Side Projects

Drinksly: iOS, SwiftUI - 2020

- Drinksly is an application developed to connect the coffee community with the mysterious secret menu. It is written in SwiftUI and takes inspiration from genuine apple products by implementing the Human Interface Guidelines.
- The content provided on the app is crafted and published using CloudKit. There is a storage layer that utilizes Core Data and there is even a caching layer to reduce the amounts of calls to fetch the images on scrolling.

Knight Spots: iOS, Swift using UIKit - 2019

- Knight Spots was created in the spring of 2019 as a means to an end for the students at the University of Central Florida. Parking was hard to come by and the students hated using the online portal to find parking.
- The application was created using UIKit and used a third-party backend database, Firebase. The content was fetched from the readily available API and was stored into the database and was updated every minute. This was achieved by leveraging Python and Heroku.
